SOURCES AND METHODOLOGY

Baseline Population:

1. 1990 and 2000 figures published by the comprehensive decennial estimates of the U.S. Census Bureau
2. 1998 and 2005 figures are derived from interdecennial parish-level estimates published by the Census Bureau. GCR assumed a uniform change throughout the city between the 1990 and 1998 estimates and between the 2000 and 2005 estimates, such that the percentage of fewer residents between those time periods is equal in each basin.

Post-Katrina Population:

The quarterly post-Katrina population estimates are based on GCR's "activity index," which monitors resettlement activity on a block level throughout the city. The primary data set for this index is a comparision between the number of active utility accounts on a given block at a pre-Katrina period to a post-Katrina period. Demographers at GCR use the results of this comparison and compare them to other small-area repopulation indicators such as active postal accounts, garbage cart registration, voter registration, and building permits.

Five-, Ten-, Fifteen-, and Twenty-Year Population Projections:

These projections were completed throughout the summer and fall of 2007 by demographic analysts at GCR. The forecasts are based on field samples of representative blocks in categories relating to storm damage, income levels, and ongoing renovation activity. The result of these surveys was the development of block-level projections throughout the city.
